**MAGNETIC TREATMENT OF THE WATER AND FOOD  
IN ANIMAL AND AGROINDUSTRIAL FIELD**

**NEW FUNCTIONALITY WITH THE APPLICATION  
OF NEW ARA IONIC ACCELERATOR**

Born to be used in agroindustrial field, after several trials, new series 7000 of the ionic accelerators New Ara has given also in these fields excellent results.

After to have drunk the magnetized water or to have been fed with liquid animal food, passed through our accelerators, the sucking calves have given one qualitative and quantitative variation of the meat, as below evidenced.

In practice, the new technique consists in the magnetic exposure through the ionic accelerator New Ara 7000, given on the flow in open or circulatory system.

The practical development of the apparatus is based on a meticulous maintenance of the regimen of flow of the equipment and an adaptation of the same to the type and the quality of the available water, on the planning of a well defined orientation between the Hydro-magnetic Field and the Magnetic one, and on the determination of the types of material used for the construction of the system and the various components as well.

In a wide variety of tests in countryside, including it both the quality of the animal life and the agricultural cultivations, it has been found to exist a great similarity between outcomes acquired after the magnetic treatment of the drinkable water feeding cows, sheep, goats, hens, geese, turkeys, etc., and those obtained with water for irrigation magnetically dealt for the cultivations of maize, tomato, lettuce, melons, grape, cotton and others.

## **Parallel effects in animal and plants**

### **Animals**

- Increase in the weight of flesh of the newborn calves, the poultry, etc.
- Growth of the quality of the products (fertility, clutch, milk and eggs).
- Extension of the productive season, the curve of productivity in the time, continuation of productivity in the normal periods.
- High quality of the final product (ratio meat/fat, splendour of the hair).
- Improvement of the quality of the water, elimination of the algae, elimination of the encrustations causing the occlusion of the tubes.

### **Plants**

- Bigger fruits.
- Increase of the products for unity of surface.
- Extension of the seasons of cultivation (ripening, fructification) in respect of the usual times.
- High quality of the fruits (dimensions, shape, sugar content, leaves more green).
- Reduction of fertilizers.
- Lesser obstructions caused by encrustations in the tubes.

Water constitutes the distributive phase of the biological fluids and the greater part of the weight of the living things, both plants and animals.

Water therefore is the predominant part of the mechanism and the process of transfer of the masses in the various systems, including the transfer through membranes.

**Water assumes different characteristics when it contains electrolytic solutions, that are different from those found in drinkable or irrigation waters. It has been demonstrated that the effect of the exposure to the magnetic fields increases with increasing of the content of solutes.**
